```
The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTS). They can be used to stimulate call growth, to regulate the haematopoiesis e.g. to treat applastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate activin or inhibin e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkinson's disease. The present sequence is a protein of the invention.
An isolated polynucleotide for treating diseases associated with its encoded polypeptide such as cancer and multiple sclerosis -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes [1] in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (ABB9912, to ABB9912, encoding the protein sequences in ABB57020 to ABB97374) or by determining the expression profile of a gene group comprising these genes. The expression profile of a gene group comprising these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and ABI99914 represent PCR primers for a mouse ischaemic condition related sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LLTRQPAPLSQKQRSFVTFRGBPAE-GFNHLVVDERTGHIYLGAVNRIYKLSSDLKVLVT

                                                                                                                                                                                                                                                                                    The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL016176) and the encoded proteins
                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin domain. The plexin polymuclectides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical industry. In particular, the plexin polymuclectides and polypeptides are useful for generating compounds (e.g. plexin-specific binding agents or antibodies) for treating or diagnosing a disease or disorder involving aberrant cell growth (e.g. hyperplasia, neoplasia, cancer or neurodegenerative disease), or diseases or disorders involving aberrant immune regulation (e.g. autoimmune diseases such as lupus, inflammatory

                                                                                                       The sequence represents Human Plexin-B2. Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin domain. The plexin polymucleotides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical industry. In particular, the plexin polymucleotides and polypeptides are useful for generating compounds (e.g. plexin-specific binding agents or antibodies) for treating or diagnosing a disease or disorder involving aberrant cell growth (e.g. hyperplasia, neoplasia, cancer or aberrantive disease), or diseases or disorders involving aberrant immune régulation (e.g. autoimmune diseases such as lupus, inflammatory bowel disease or Diabetes Type 1), or immunosuppressive diseases such as multiple sclerosis or rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          99

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences ABB10981-ABB12330 represent 1150 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides of identifying compounds which bind to polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities; including cytokine, cell proliferation or cell differentiation activities; seem cell growth factor activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity: or inhibin-related activities;

chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliocating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell cancers), chronic inflammantory conditions (e.g., arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound crepair (or nucleic acids encoding them) may be used to promote wound crepair (or nucleic acids encoding them) may be used to promote wound crepair (or nucleic acids encoding them) may be used to promote coll growth. For example, such polypeptides with growth factor activity may be used in call cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The presents a novel human collypeptide of the invention.

                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated polymuclectide (I) and colympetide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polymclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques contracted normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical maging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of responsible for generic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

treating or ameliorating a medical condition in a mammalian subject Human proteins and DNA encoding sequences useful for preventing e.g. arthritis and cancer -

Claim 20; Page 231-232; 1963pp; English

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA05574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of identifying compounds which corp polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby clypeptides of the invention have homology to known proteins, thereby comparing a insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may complete activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; have various activities; arem cell growth factor activity; chaematopolesis regulatory activity; tissue growth activity; chaematopolesis regulatory activity; tissue growth activity; chaematopolesis regulatory activities; haemostatic, thrombotic or chemokinetic activities; haemostatic, thrombotic or chemokinetic activities; haemostatic, thrombotic or chemokinetic activities; polypeptides and nucleotides of involved in oncogenesis, cancer cell proliferation or metastasis.

Complication are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions and use useful for preventing, treating or parthrities, conditions, e.g., by protein or gene therapy. Such conditions and abnormal confidences, haematopoletic disorders (e.g., myeloid or lymphoid cell actorier growth. Polypeptides involved with tissue regeneration and regineral ischaemia, bone disorders (e.g., osteoporosis), and abnormal crepair (or nucleic acids encoding them) may be used to promote wound immunomodulatory activities may be used in the treatment of viral, immunomodulatory activities may be used in the treatment of viral,

Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to amoment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and mucleotides screening techniques. The present sequence represents a novel human polypeptide of the invention. and fungal infections in addition to immune disorders 8888888888888

```

The sequence represents Human Plexin-D1. Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin domain. The plexin polymucleotides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical

                                                                                                                                                                                                                                                                                            Domain
                                                                          8
                  ద
```

The sequence represents Human Plexin-B3. Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin domain. The plexin polymucleotides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical industry. In particular, the plexin polymucleotides and polypeptides are useful for generating compounds (e.g. plexin-specific binding agents on antibodies) for treating or diagnosing a disease or disorder involving aberrant cell growth (e.g. hyperplasia, neoplasia, cancer or neurodegenerative disease), or diseases or disorders involving aberrant immune regulation (e.g. autoimmune diseases such as lupus, inflammatory bowel disease or Diabetes Type 1), or immunosuppressive diseases such as multiple sclerosis or rheumatoid arthritis.

cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), colliferative retinopathy, atherosclerosis, coronary heart disease, coronary heart disease, carterial ischemmia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and crepair (or nucleic acids encoding them) may be used to promote wound coronary expensively and inclusions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, contoinmune disease or accidental damage. The polypeptides and nucleotides cutoimmune disease or accidental damage. The polypeptides and in drug screening techniques. The present sequence represents a novel human compared to invention.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comptibiling a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence polypeptides of the invention activities, explications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities, stem cell growth factor activity; haematopoiesis regulatory activity; tissue growth activities; hemokancoulatory activity; activity or inhibin-related activities; chemotactic or chemokinetic activities; haemostatio, thrombotic or thrombolytic activities; receptor or ligand activities; or may be involved in oncogeneals, cancer cell proliferation or metastasis.

The permittion are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer -Claim 20; Page 239; 1963pp; English.

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA essiby without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   50 GFNHLVVDERTGHIYLGAVNRIYKLSSDLKVLVTHETGPDEDNPKCYPPRIVQTCNEPLT 109

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1750 NMIKNPQFVFDIHKNSITDACLSVVAQTFMDSCSTSEHRLGKDSPSNKLLYAKDIPSYKN 1809
                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide provided in the specification.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for synthesizing full length cDNA clones and their

WPI; 2000:572271/53. N-PSDB; AAC58585. Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus.

Claim 33; Fig 14; 309pp; English.

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic solerosis, idiopathic inflammatory myopathies, Sjogren's systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demopelinary diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, untoimmune or immune-mediated skin diseases, allergic diseases, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease.

ARCS837 to AACS8278 represent PCR primers and hybridisation probes used in the isolation of human PRO polynucleotide and protein
